Field of application

Type EFST filter elements of filtration grades ZN, XN, XXN are mainly designed for separating liquid aerosols, i.e. smallest, nebulous liquid droplets (coalescing filtration, wet-type filtration) as well as for separating finest dust contaminants (fine dust filtration, dry-type filtration) from compressed air flows. Larger droplets or amounts of liquids are, of course, also separated during this process.

Features

Type EFST filter elements of filtration grades ZN, XN, XXN consist of a pleated depth filter media and a separately located drainage media. The two functional layers are compactly located between the two stainless steel cylinders and therefore completely integrated in the filter element.

Thanks to the pleating technology the effective filter surface is increased many times resulting in a higher dirt holding capacity and a longer service life. At the same time the flow resistance and therefore differential pressure generated by the filter element is considerably reduced. Due to the separation of the two function units, filtration and drainage, which are both fundamental for the filter element, the function of the remaining layer is guaranteed even if one filter layer breaks. To avoid a breakthrough at an early stage, the pleated depth filter cylinder has two or more layers. In addition, it is provided with a pleated supporting fabric on the inside and outside. All media are located within the two stainless steel cylinders. In this way, breaking off completely or in parts of the filter layer used for filtration is impossible.

All the features mentioned above are a contribution to a filter element which has a high performance (high separation efficiency) combined with economic efficiency (low differential pressure) and maximum operating safety (integrated design).

Basic data

Model	Nominal volume flow (VN) ^{*1}	Max. operating pressure	Min./Max. operating temperature
EFST 25	35 m ³ /h (1.00)	---	+2°C - +65°C
EFST 30	50 m ³ /h (1.00)		
EFST 50	70 m ³ /h (1.02)		
EFST 70	100 m ³ /h (0.67)		
EFST 90	160 m ³ /h (0.87)		
EFST 110	330 m ³ /h (0.91)		
EFST 120	500 m ³ /h (0.92)		
EFST 130	800 m ³ /h (0.91)		
EFST 140	1,000 m ³ /h (0.93)		
EFST 170	1,500 m ³ /h (0.92)		
EFST 180	2,000 m ³ /h (0.95)		
EFST 190	2,500 m ³ /h (0.95)		

*1 – refers to 1 bar(a) and 20°C at 7 bar operating pressure

The factor in brackets specifies the relation of the flow of the filter element for each cm² of surface compared to the EFST30 reference element.

Purity classes according to ISO 8573-1

Contamination	ZN	XN	XXN
Solid particles ^{*2}	Class 2	Class 1	Class 0-1
Water content	---	---	---
Total oil content ^{*2 *3}	Class 2	Class 1	Class 0-1

*2 - typical result, on the assumption of suitable inlet concentrations as well as operating and marginal conditions.

*3 - the amount of oil vapour is not taken into account and may reduce the purity class.

Calculation of the converted volume flow

Converted volume flow VK	Nominal required volume flow VN _{min}
$VK = VN \times F1 \times F2$	$VN_{min} = VK / F1 / F2$

VK : Converted volume flow calculated for the operating conditions

VN_{min}: Nominal required volume flow calculated for the operating conditions, based on the volume flow at operating conditions
