

Product Data Sheet

Adsorption Dryer DTS..V

Version: 1.8.1

Author: Tassilo Tappe

Date: 08.04.2021

Field of application

Adsorption dryers of the DTS..V series are designed for drying compressed air and nitrogen to pressure dew points of -25°C to -70°C (depending on the design) at operating pressures of 4 bar to 11 bar (up to 63 bar on request).

Function

Adsorption dryers consist of two pressure vessels, which are both filled with desiccant and are alternately operated via switch-over. The compressed air to be dried flows through a vessel where the moisture is thoroughly removed by the desiccant (**adsorption**). At the same time, the moisture stored in the desiccant in the second vessel is removed (**regeneration**). If the desiccant in the vessel in which adsorption takes place is saturated with moisture then the vessels are switched and the process begins again. One complete run of adsorption and regeneration in a vessel is called a **cycle**, and the time required is the **cycle time**.

For DTS series dryers, the change interval between adsorption and regeneration is 6 hours at nominal conditions. The cycle time is therefore 12 hours.

The regeneration takes place with ambient air, which is drawn in by a vacuum pump, warmed in an electric heater and fed through the desiccant (heating). The hot air removes the moisture from the desiccant and releases it to the environment at the outlet (heat regeneration).

Cooling is carried out in a similar manner with the electric heater switched off - without the need for purge air (fast cooling).

Further energy savings can be made through integration of the customer's alternative energy sources (e.g. steam or hot water) and/or thermal insulation.

Product Data Sheet

Adsorption Dryer DTS..V

Features

The dryers are operated with a 2-layer desiccant bed, consisting of 30% water resistant silica gel WS and 70% high-grade drying silica gel N. The desiccant has a high drying capacity for moisture and a long service life of several years. This ensures permanently low and stable pressure dew points.

The flow paths are switched over via pneumatically controlled 4/2-way plug valves, which are mechanically connected to each other via a cardan shaft and therefore switch in synch. Model DTS 1280 and higher uses shut-off valves with end position control. The expansion (before starting regeneration) and the pressurisation (after the regeneration) are carried out via separately controlled pneumatic actuated seat angle valves. At the expansion outlet a silencer is used for effective reduction of the expansion noise.

For this dryer size the filters are not included in the scope of supply of the dryer. But pre filters (fine filters) that prevent solid particles ($< 0.01 \mu\text{m}$) and liquid contaminants ($< 0.01 \text{ mg/m}^3$) from entering should be installed upstream of the dryers in order to increase the service life of the desiccant. An afterfilter (general purpose filter) should be installed downstream of the dryer in order to prevent possible desiccant dust ($< 1 \mu\text{m}$) from entering.

The dryers comply with the requirements of the Pressure Equipment Directive 2014/68/EU, and have the CE marking of this European directive.

Features of the controller „C10“

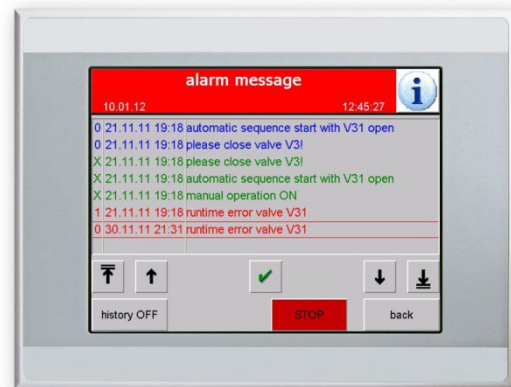

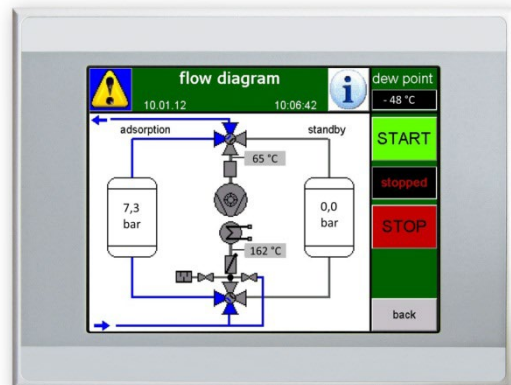

The function of the DTS series are controlled by means of a type "C10" processor control system with a 5,7" (640x480 Pixel) colour touch panel. The operation is shown on the display via flow diagram with all operating data.

Via text indicator all operating messages, alarm messages, operating hour counter, service messages are shown in plain manner.

If a pressure dew point sensor (option H) is connected, the current pressure dew point of the compressed air is also directly shown on the display and provided as a 4-20 mA signal. The pressure dew point measurement (option H) allows for dew-point dependent operation of the dryer. Depending on the load of the dryer, the adsorption cycle may be extended, i.e. the switch-over frequency is adapted to the operating situation, and less frequently heating up the system saves energy costs.

The control covers a multiplicity of monitoring criteria and safety chains. 25 different error messages and 15 different warnings can be evaluated.

All operating data (temperatures, pressures, dew-point) are recorded every minute, and saved in a circular buffer, which always has the last 2 months recording in memory. Via USB-Host the data can be downloaded at any time.

Technical Data of the controller „C10“

- 5,7" TFT colour display (Resolution VGA 640x480) , 64 colours, LED backlight, dimmable via software
- Resistive touch screen (reacted to pressure and is thus operable with the finger and electronic pen)
- Power supply 19,2 ..30,0 VDC effective (nominal 24VDC SEL V)
- Protection class IP65 (in installed condition)
- Operating system WinCE 5.0 Core
- Processor 32 Bit RISC, 400MHz
- With real time clock
- Memory DDR RAM 64 MB + retain memory NVRAM 32kB + flash memory NAND Flash 128 MB
- Download-interface (Trend recording download) via USB-Host
- Upload-interface (Program-Upgrade) via SD Memory card

Input signals of controller „C10“

- PT01 – Pressure vessel 1 (4-20mA)
- PT02 – Pressure vessel 2 (4-20mA)
- TT01 – Temperature Regeneration air inlet (PT100)
- TT02 – Temperature Regeneration air outlet (PT100)
- MT01 – Pressure dew point (optional, 4-20 mA)
- TSH01 – Limiter thermostat heater
- GS03 – Limit switches for position of regeneration air valve
- GS01 – Limit switches for position of main valves (optional)

Output signals and interfaces of controller „C10“

- 2 voltage free contacts (operating message and common alarm)
- 2 analog signals 4-20 mA (pressure dew point and operating pressure)
- USB Host for downloading the trend recording
- **OPTIONAL** : Profibus, Modbus, CANbus, Ethernet, ... and many more

*3 – for operating pressures lower than 4 bar(g) an external control air supply > 4 bar(g) needs to be provided

*4 – Dryers with operating pressure > 11 bar (g) on request

Calculation of the converted volume flow

Converted volume flow VK	Nominal required volume flow VN_{min}
$VK = VN \times F$	$VN_{min} = VK / F$

VK : Converted volume flow calculated for the operating conditions

VN_{min} : Nominal required volume flow calculated for the operating conditions, based on the volume flow at operating conditions

Please contact the technical support team for a professional sizing of the dryer

Maintenance rules

	Maintenance interval and maintenance activities
All Models	<ul style="list-style-type: none"> ■ Once a week : <ul style="list-style-type: none"> - Check differential pressure of prefilter if installed - Check function of the condensate drains at prefilter if installed ■ yearly : <ul style="list-style-type: none"> - Replace filter elements on prefilter and afterfilter if installed - Check expansion silencer, clean or replace, if required - Calibrate dew point sensor (option H) (interchange principle possible) ■ Every 2 years: <ul style="list-style-type: none"> - Replace solenoid valves (pilot valves) ■ Every 4 years: <ul style="list-style-type: none"> - Replace desiccant, sleeve cylinder and seals *7 *8 ■ Every 5 /10 years <ul style="list-style-type: none"> - Pressure vessel inspection acc. to Ordinance on Industrial Safety and Health of September 27th, 2002 (BGBl. I p. 3777) §15, - Inside check every 5 years - Strength test (hydrostatic) every 10 years, both carried out by an authorised inspection agency, see page 9

*5 – The regular service life of the desiccant is 3 - 5 years, however, it is very much depending on the contamination level of the incoming compressed air and the operating temperature. In order to achieve the specified service life of the desiccant, it is vital to exchange the filter elements as described above.

*6 – The desiccant and the activated carbon must be disposed of according to the European waste code. A possible oil contamination must be taken into account.

Adsorption Dryer DTS..V

Accessories

The **DA-CM1-230 switch-over control system** enables the control of two redundant compressed air dryers in a compressed air system. The two dryers can be operated alternately while switching-over automatically. All dryers, provided with a «remote start/stop contact» or a «compressor synchronisation contact», can be directly connected to the switch-over control system without the need for any further modifications. The DA-CM1-230 also controls all required shut-off valves (no scope of supply) to open or close the compressed air line to a dryer (e.g. solenoid valves or valves with actuating drive for 230V AC supply voltage). Furthermore, additional input signals can be hooked up to the common alarm message of each dryer. Beside the power supply the DA-CM1-230 provides alarm inputs for condensate drains, differential pressure gauges, etc. for each dryer.

The **GSM Module DA-ETR-107** is an easy to install extension for all dryers with alarm contact. In case of an alarm a SMS message is send to up to 6 different recipients or, if supported by the provider, an email message. Within the message, the dryer type and serial number is transferred, if required.

The programming can be done with a usual mobile phone, protected by the PIN code of the SIM card (no scope of supply) applied to the GSM module. The DA-ETR-107 is operated with 5-32V DC supply voltage. An internal battery ensures operation of up to 120 hours in case of loss of the supply voltage. The GSM module has an integrated antenna while an external antenna can be connected in the case of low signal levels.

The **Start-up device (minimum pressure valve) DA-VPM-...** protects the dryer from overload due to high flow velocities during pressure build-up of the compressed air system. For connection size G ½ to G 2½ spring loaded angle valves are offered (DA-VPM-B../16), providing an opening pressure of 3-5 bar (standard 3.5 bar). For connection size DN80 to DN250 butterfly valves with pneumatic actuator are offered (DA-VPM-F../11), directly operated by the working pressure while opening at 3 bar (full cross-section at 4 bar). Special versions with adjustable opening pressure or working pressures of up to 450 bar are available on request.

Differential pressure gauges FAD01C with potential free alarm contact allow to hook up the differential pressure control of the pre- and after-filter to the common alarm message of each dryer. In order to avoid a false error report due to start-up conditions or short-time peaks, an alarm delay can be set in the dryer control unit. The alarm message then will just be generated, if a too high differential pressure was indicated during the entire delay time interval.

... and many more. Please contact us.
